EXPLORE INDIA

WEB DEVELOPMENT PROJECT REPORT

Your Journey Begins Here

Project	Explore India Travel Portal
Technology	HTML5, CSS3 and JavaScript
Project Type	Front-end / Static Travel Website
Purpose	Educational web development project

A simple-English guide to the website, its features, design, and browser output.

Prepared for academic learning and project presentation.

1. Introduction

Explore India is a sample travel website that presents popular destinations, holiday packages, a sample travel itinerary, and a travel inquiry form. It is designed to help visitors explore travel options in a clear and attractive layout. HTML creates the page structure, CSS controls the design, and JavaScript adds simple interactions.

2. Project Objectives

• Create a clear homepage for an India travel portal.
• Display popular destinations such as Kerala, Goa, and Manali.
• Present holiday packages with duration and sample prices.
• Show a sample day-by-day travel itinerary.
• Collect visitor details through a travel inquiry form.
• Practise responsive web design and basic JavaScript interactions.

3. Technologies Used

HTML5: Organises the header, navigation, hero section, destination cards, packages, itinerary, form, and footer.
CSS3: Adds colours, spacing, grid layout, card styles, hover effects, and responsive media queries.
JavaScript: Selects a package, fills the destination field, scrolls to the inquiry form, and displays a demo confirmation message.

4. Website Sections

Header and Navigation: Displays the Explore India title and links to Home, Destinations, Packages, Itinerary, and Contact.
Hero Section: Shows “Your Journey Begins Here” with a travel background and Explore Packages button.
Popular Destinations: Displays Kerala, Goa, and Manali with images and short descriptions.
Holiday Packages: Shows three travel packages with durations, inclusions, prices, and Select Package buttons.
Sample Itinerary: Presents a three-day Goa travel plan.
Travel Inquiry Form: Collects name, email, destination, travel date, number of travellers, and additional requirements.
Footer: Displays the website copyright and tagline.

5. Important Code Concepts

• **CSS Grid:** Places destination and package cards in columns.
• **Flexbox:** Arranges the header title and navigation links.
• **Media Queries:** Change the grid to two columns and then one column on smaller screens.
• **Hover Effects:** Change link/button appearance and lift cards slightly when hovered.
• **Anchor Links:** Move the visitor to a section using IDs such as #packages and #contact.
• **DOM Manipulation:** JavaScript updates the destination field and result message.

6. Website Output Screenshot

The following is the browser output supplied with the project. It shows the navigation bar, hero banner, destination cards, holiday packages, itinerary, travel inquiry form, and footer.

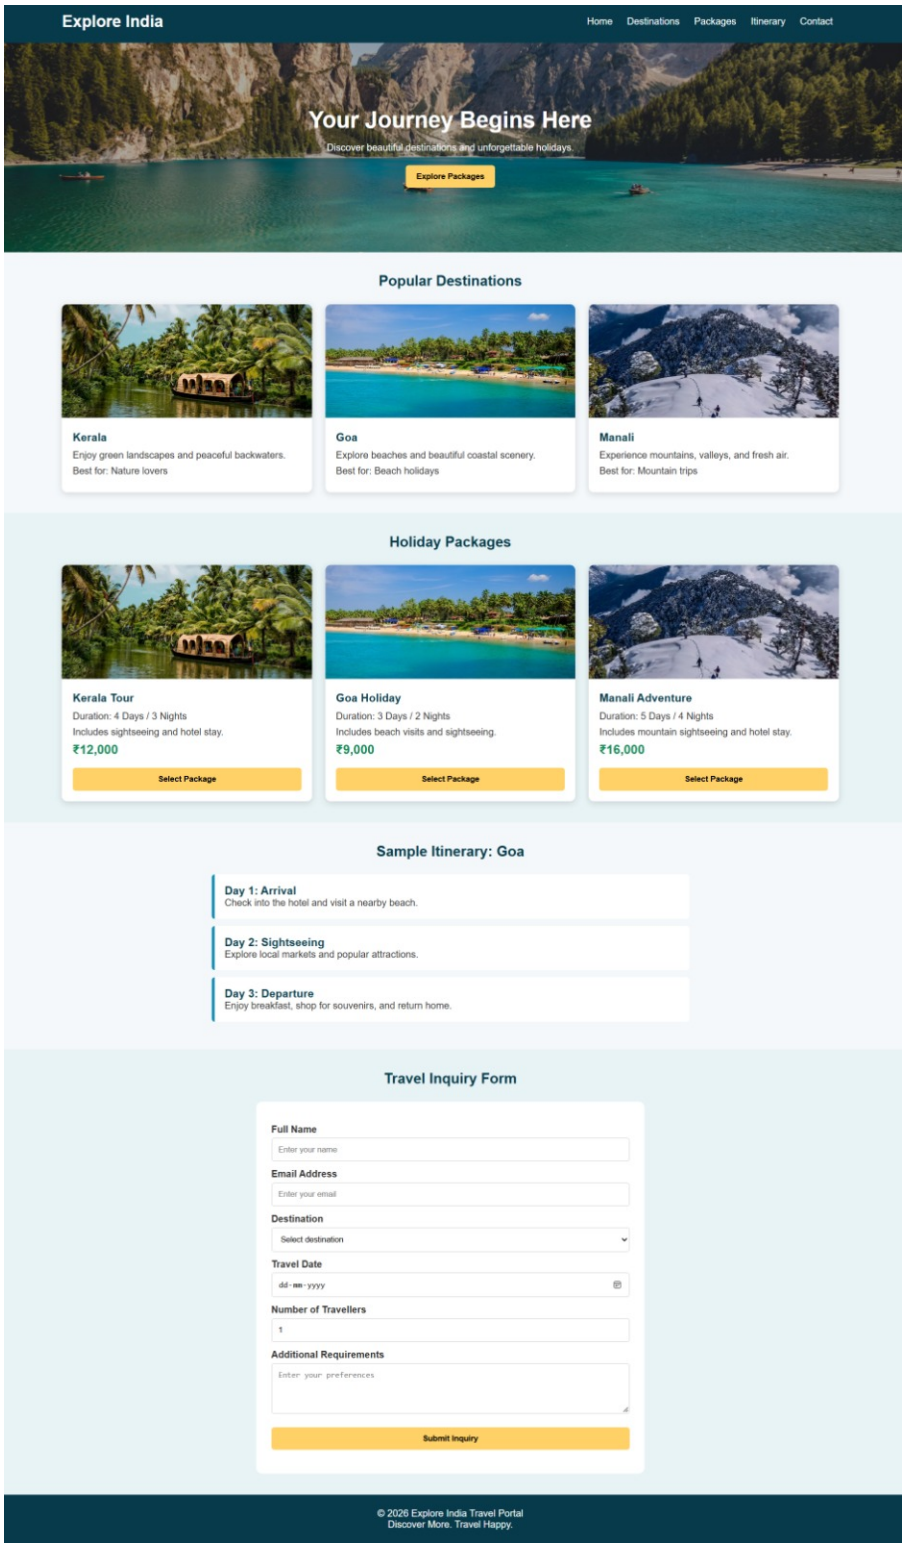

Figure 1. Explore India Travel Portal website output (user-supplied screenshot).

7. How the Website Works

1. The browser reads the HTML and creates the page structure.
2. CSS styles the header, hero section, cards, form, and footer.
3. Navigation links move the visitor to the matching page section.
4. The Select Package button calls the chooseTrip() function, selects the destination in the form, and scrolls to the Contact section.
5. When the form is submitted, JavaScript prevents the default page reload and displays a thank-you message using the entered name and selected destination.
6. The form is reset after the demo message is displayed.

8. Observations and Improvements

- The package prices and travel information are sample educational content.
- The form currently displays a demo confirmation only; it does not send data to a server or save it in a database.
- A future version could connect the form to a backend, database, email service, or booking system.
- More destinations, package filters, booking confirmation, and payment features could be added.
- The external destination images require an internet connection to load.

9. Conclusion

Explore India demonstrates how HTML5, CSS3, and JavaScript can be combined to build a responsive travel website. It includes destination information, holiday packages, a sample itinerary, and an interactive inquiry form. The project provides practice with page structure, styling, responsive layouts, navigation links, DOM manipulation, and form events.

10. Quick Viva Questions

Q1. What is the purpose of this project?
To display Indian travel destinations, packages, itinerary details, and an inquiry form.

Q2. Which technologies are used?
HTML5, CSS3, and JavaScript.

Q3. What is CSS Grid used for?
To arrange destination and package cards in columns.

Q4. What is a media query?
A CSS rule that applies styles at specified screen widths.

Q5. What happens when Select Package is clicked?
The destination is selected in the form and the page scrolls to the inquiry section.

Q6. Does the form save information in a database?
No. It displays a demo confirmation message and resets the form.

Appendix A. Complete HTML, CSS and JavaScript Source Code

The complete source code supplied for the Explore India Travel Portal is included below.

```
<!DOCTYPE html>
